

DC/DC Converter Controller

The MC34063AF/AP series is a monolithic control circuit containing the primary functions required for DC-to-DC converters. These devices consist of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit. driver and high current output switch. This series was specifically designed to be incorporated in Step-Down or Step-Up or Voltage-Inverting applications with a minimum number of external components.

FEATURES

- Operation from 3.0V to 40V input.
- Low Standby Current.
- Current Limiting.
- Output Switch Current to 1.5A.
- Output Voltage Adjustable.
- Frequency Operation to 100kHz.
- Precision 2% Reference.

TOTAL DEVICE

CHARACTERISTIC	SYMBOL	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Current	I_{CC}	$V_{CC}=5.0 \sim 40V$, $C_T=1.0nF$, Pin 7= V_{CC} , Pin 2=GND, $V_{PIN5}>V_{TH}$, remaining pins open	-	-	4.0	mA

Note) 2. Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.

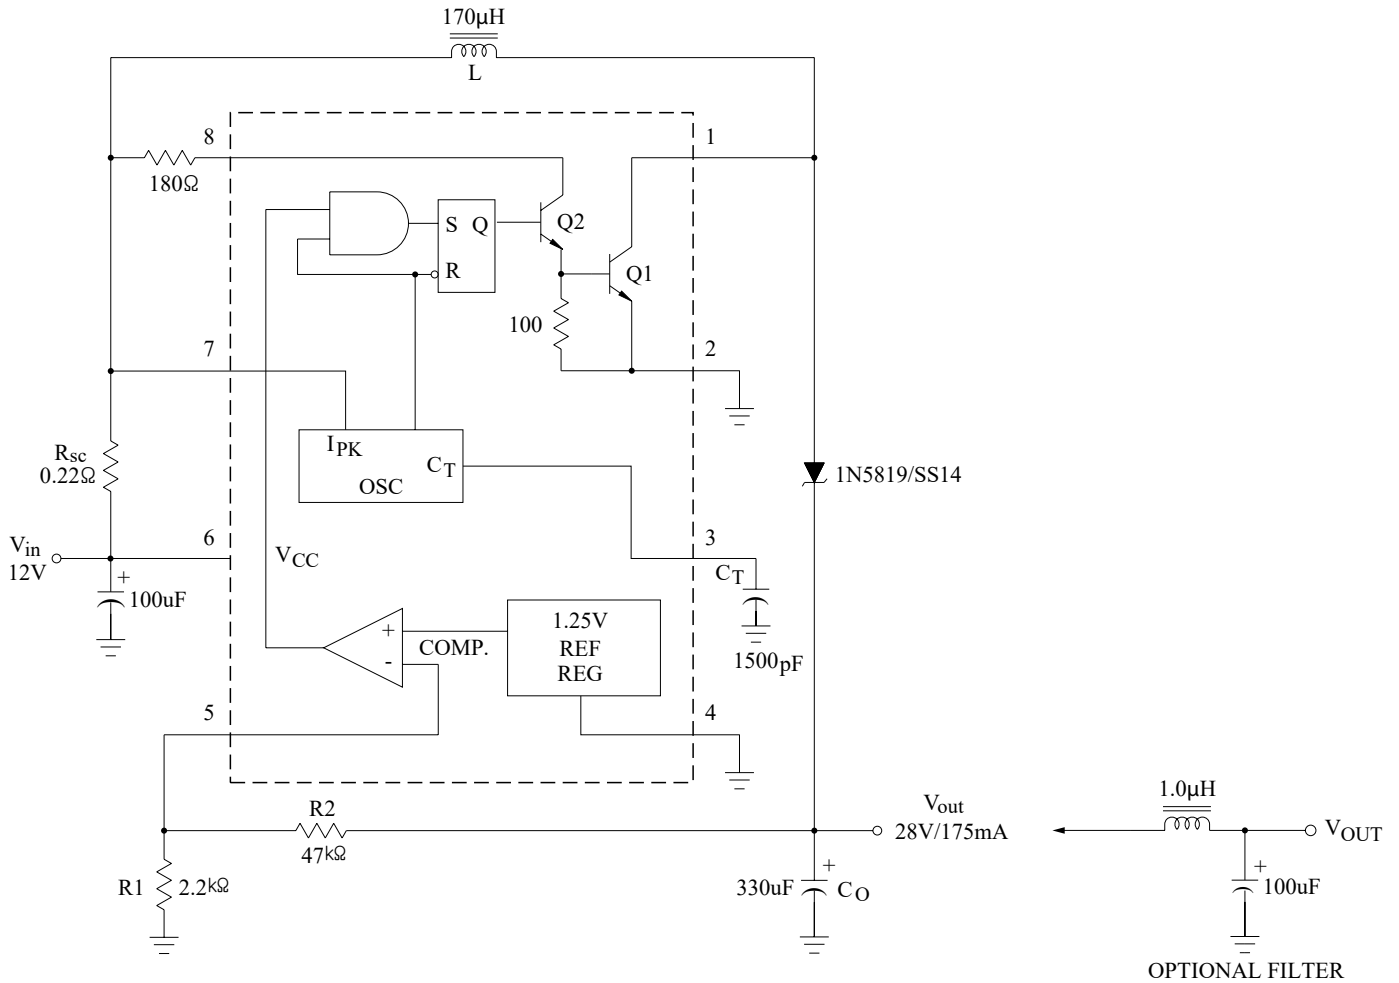

3. If the output switch is driven into hard saturation (non-Darlington configuration) at low switch currents ($\leq 300mA$) and high driver currents ($\geq 30mA$), it may take up to $2.0\mu S$ for it to come out of saturation. This condition will shorten the off time at frequencies $\geq 30kHz$, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-Darlington configuration is used, the following output drive condition is recommended ;

$$\text{Forced of output switch : } \frac{I_{C \text{ output}}}{I_{C \text{ driver}-7.0mA *}} \geq 10$$

* The 100Ω resistor in the emitter of the driver device requires about $7.0mA$ before the output switch conducts.

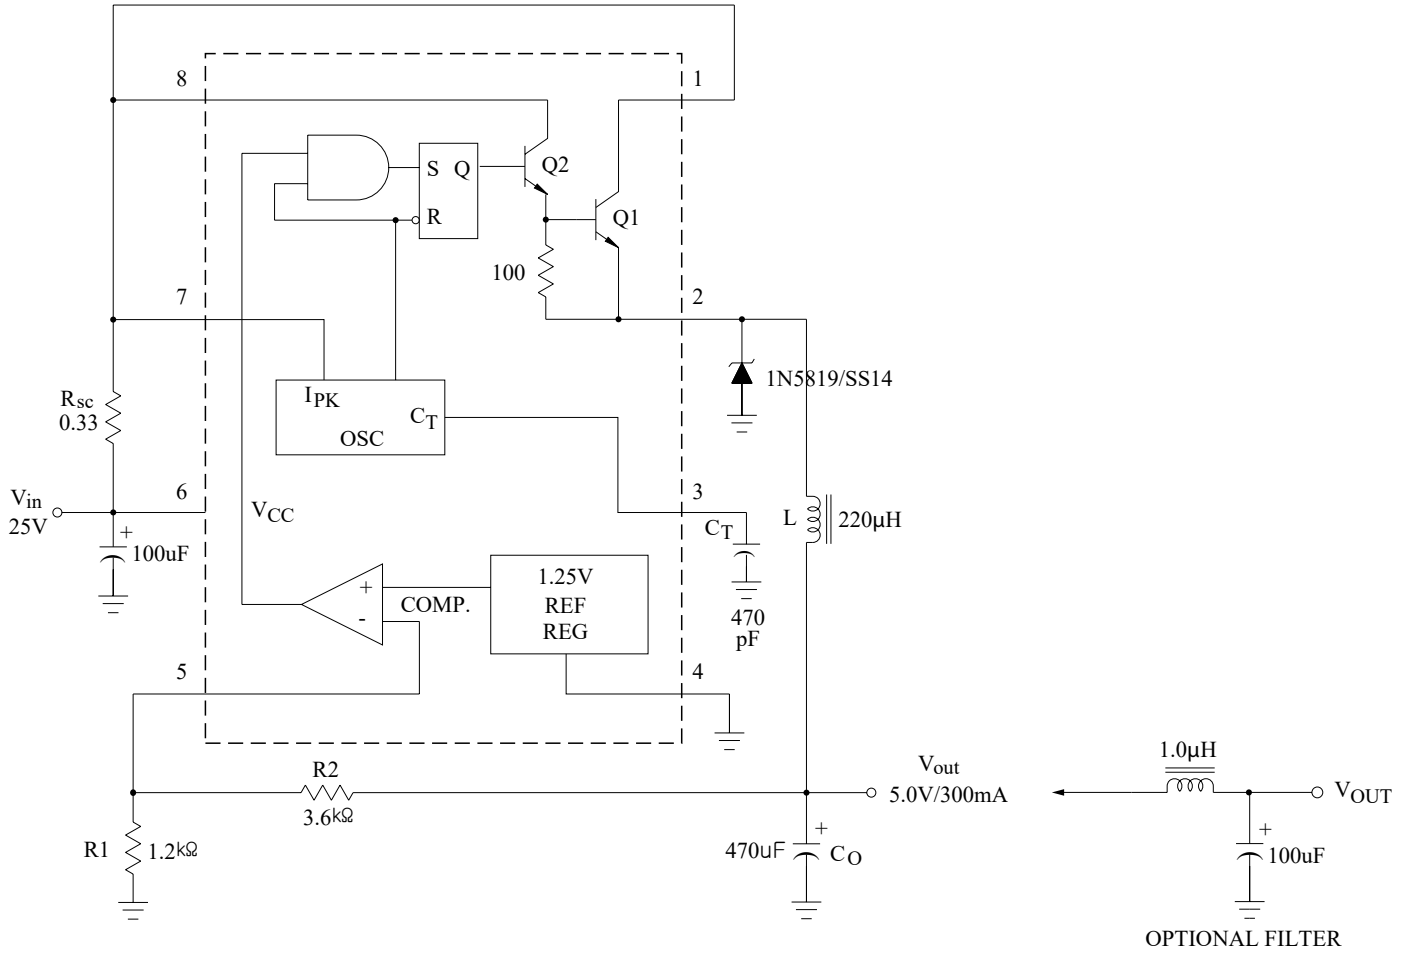

APPLICATION CIRCUIT

(1) Step-up Converter

TEST	CONDITIONS	RESULTS

NOTES:

V_{sat} = Saturation voltage of the output switch

V_F = Forward voltage drop of the output rectifier

THE FOLLOWING POWER SUPPLY CHARACTERISTICS MUST BE CHOSEN:

V_{in} = Nominal input voltage

V_{out} = Desired output voltage, $|V_{out}| = 1.25(1+R_2/R_1)$

I_{out} = Desired output current

f_{min} = Minimum desired output switching frequency at the selected values of V_{in} and I_o

V_{ripple} = Desired peak to peak output ripple voltage. In practice, the calculated capacitor value will and to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
