

# 36V Low Current Consumption 250mA CMOS Voltage Regulator

## ■ INTRODUCTION

The FC6375 series are a group of positive voltage regulators manufactured by CMOS technologies with low power consumption and low dropout voltage, which provide large output currents even when the difference of the input-output voltage is small. The FC6375 series can deliver 250mA output current and allow an input voltage as high as 36V. The series are very suitable for the battery-powered equipments, such as RF applications and other systems requiring a quiet voltage source.

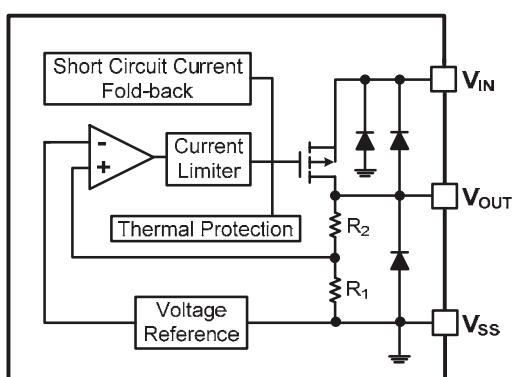

## ■ FEATURES

- Low Quiescent Current: 2 $\mu$ A
- Operating Voltage Range: 2.5V~36V
- Output Current: 250mA
- Low Dropout Voltage: 400mV@100mA( $V_{OUT}$ =3.3V)
- Output Voltage: 1.8~12V
- High Accuracy:  $\pm 2\%/\pm 1\%$ (Typ.)
- High Power Supply Rejection Ratio: 70dB@1kHz
- Low Output Noise: 27x $V_{OUT}$   $\mu$ V<sub>RMS</sub>(10Hz~100kHz)
- Excellent Line and Load Transient Response
- Built-in Current Limiter, Short-Circuit Protection
- Over-Temperature Protection
- Stable with Ceramic or Tantalum Capacitor
- Wireless Communication Equipments
- Portable Audio Video Equipments
- Car Navigation Systems
- LAN Cards
- Ultra Low Power Microcontroller

## ■ APPLICATIONS

- Cordless Phones
- Radio control systems
- Laptop, Palmtops and PDAs
- Single-lens reflex DSC
- PC peripherals with memory

Operating Junction Temperature Range <sup>(3)</sup>	$T_j$	150	$^\circ\text{C}$
Storage Temperature	$T_{stg}$	-65~150	$^\circ\text{C}$
Lead Temperature(Soldering, 10 sec)	$T_{solder}$	260	$^\circ\text{C}$
ESD rating <sup>(4)</sup>	Human Body Model -(HBM)	2	kV
	Machine Model- (MM)	100	V

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to network ground terminal.

(3) This IC includes over temperature protection that is intended to protect the device during momentary overload. Junction temperature will exceed  $125^\circ\text{C}$  when over temperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

(4) ESD testing is performed according to the respective JESD22 JEDEC standard.

### Selection of Input/ Output Capacitors

In general, all the capacitors need to be low leakage. Any leakage the capacitors have will reduce efficiency, increase the quiescent current.

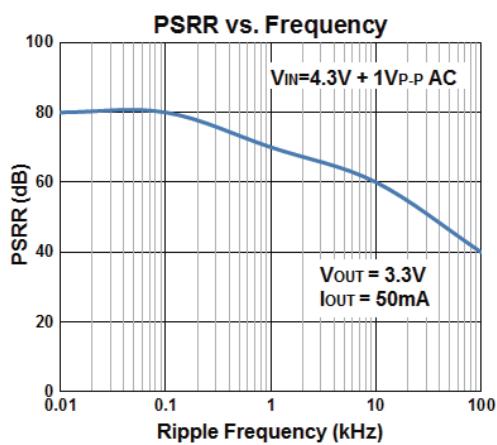

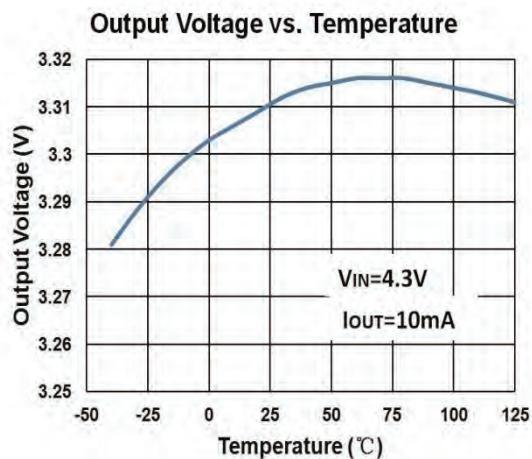

A recent trend in the design of portable devices has been to use ceramic capacitors to filter DC-DC converter inputs. Ceramic capacitors are often chosen because of their small size, low equivalent series resistance (ESR) and high RMS current capability. Also, recently, designers have been looking to ceramic capacitors due to shortages of tantalum capacitors.

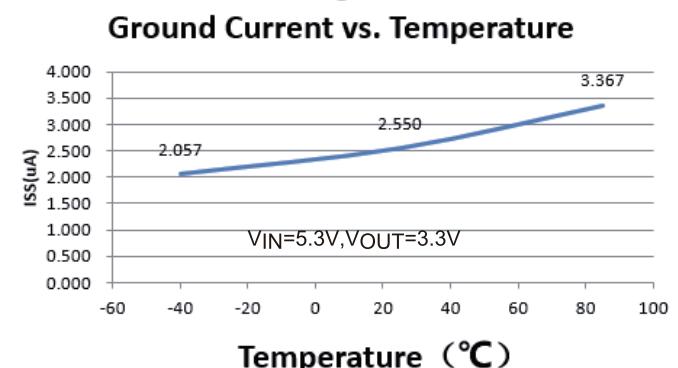

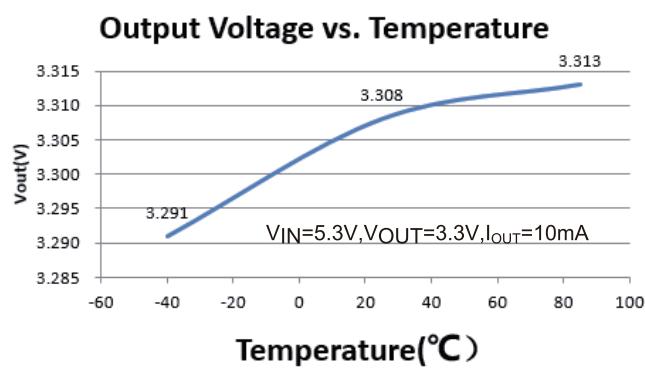

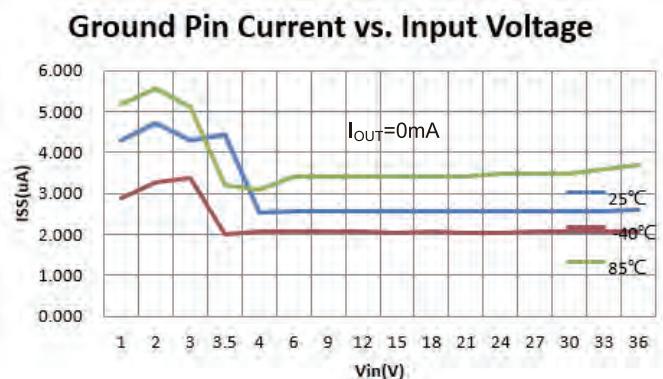

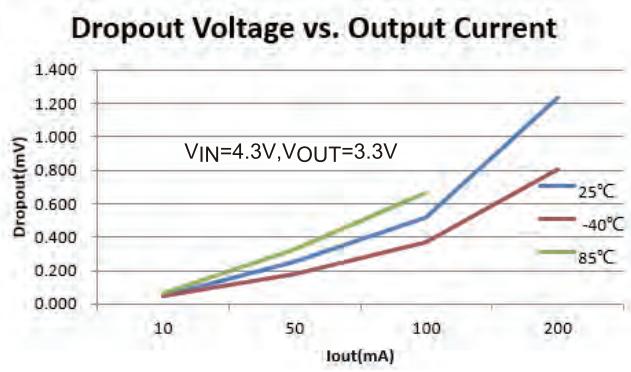

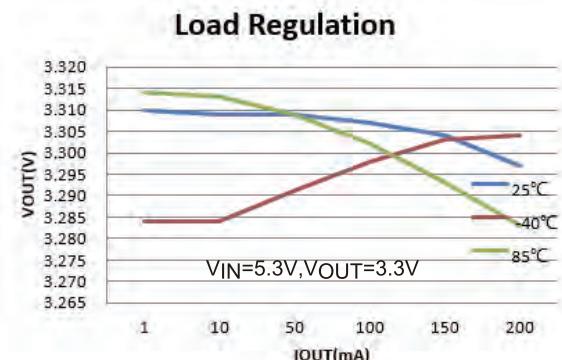

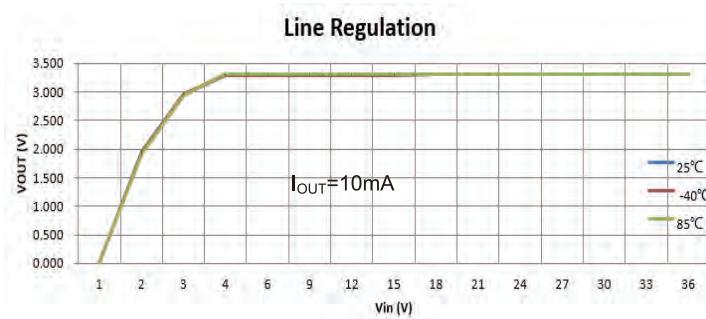

Unfortunately, using ceramic capacitors for input filtering can cause problems. Applying a voltage step to a ceramic capacitor causes a large current surge that stores energy in the inductances of the power leads. A large voltage spike is created when the stored energy is transferred from these inductances into the ceramic capacitor. These voltage spikes can easily be twice the amplitude of the input voltage step. (See "Ceramic Input Capacitors Can Cause Overvoltage Transients"—Linear Technology application note 88, March 2001)

Many types of capacitors can be used for input bypassing, however, caution must be exercised when using multilayer ceramic capacitors (MLCC). Because of the self-resonant and high Q characteristics of some types of ceramic capacitors, high voltage transients can be generated under some start-up conditions, such as connecting the LDO input to a live power source. Adding a  $3\Omega$  resistor in series with an X5R ceramic capacitor will minimize start-up voltage transients.

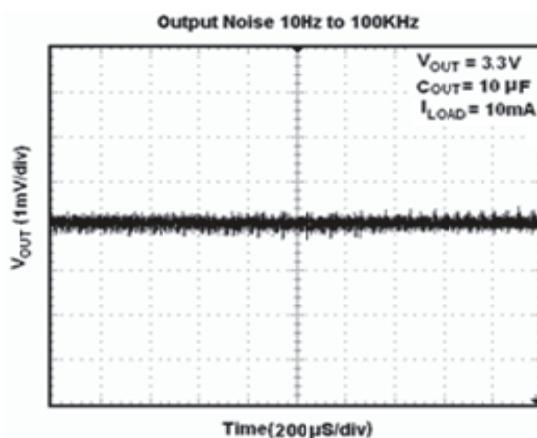

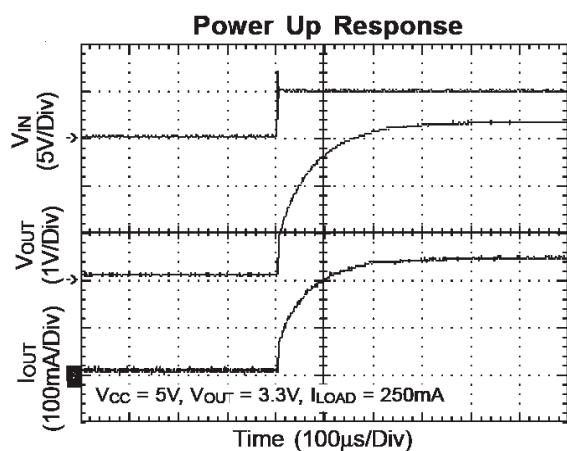

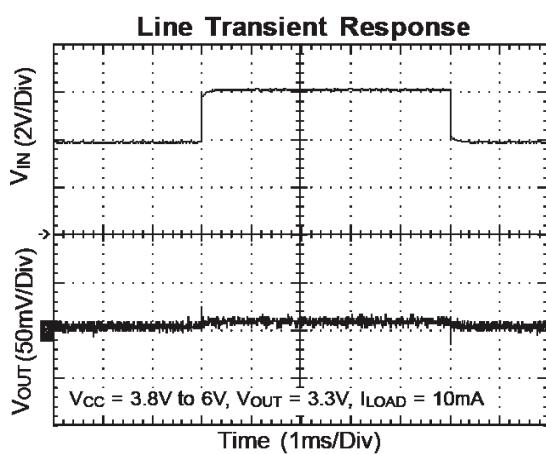

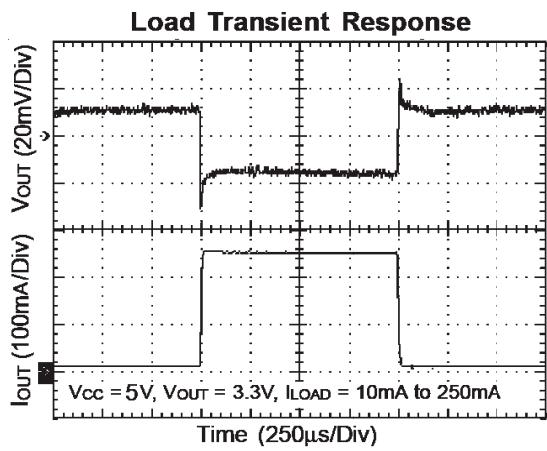

The LDO also requires an output capacitor for loop stability. Connect a  $1\mu\text{F}$  tantalum capacitor from OUT to GND close to the pins. For improved transient response, this output capacitor may be ceramic.
